

# Fuse Studio — Full Setup Guide (Supabase · Paystack · Netlify)

This is the complete, plain-English walkthrough. No coding. Take it slowly — about **45–60 minutes** the first time. Do the parts in order.

## The big picture (how the 3 pieces fit)

Think of your app as **3 helpers** working together:

| Helper            | What it does                                                                | Cost           |
|-------------------|-----------------------------------------------------------------------------|----------------|
| ● <b>Supabase</b> | The <b>logins + database</b> . Remembers users, credits, payments.          | Free to start  |
| ● <b>Paystack</b> | The <b>cashier</b> . Takes bank transfers → pays into <b>your</b> bank.     | ~1.5% per sale |
| ● <b>Netlify</b>  | The <b>host</b> . Runs your website + the secure code that holds your keys. | Your \$9 plan  |

The **secret keys** (MuAPI, Paystack secret, Supabase service key) live only inside **Netlify** — never in the public website. That's what keeps your money safe. 🔑

## PART 1 — ● Supabase (logins + database)

### 1.1 Create the project

1. Go to **supabase.com** → **Sign up** (use Google for speed).
2. **New project**. Give it a name (e.g. `fuse-studio`).
3. Set a **database password** (save it somewhere — you rarely need it).
4. **Region**: pick the closest to Nigeria → **West EU (London)** or **EU (Frankfurt)**.
5. Click **Create** and wait ~2 minutes while it sets up.

### 1.2 Build the tables (run the 3 SQL files)

On the left menu click **SQL Editor** → **+ New query**. Then, **one at a time**: 1. Open the file **supabase/schema.sql** from your repo, copy **everything**, paste it in, click **Run** (bottom right). You should see *Success*. 2. New query again → paste **supabase/schema-phase2.sql** → **Run**. 3. New query again → paste **supabase/schema-phase3.sql** → **Run**. 4. New query again → paste **supabase/schema-phase4.sql** → **Run** (this also creates the `avatars` storage bucket for the Avatar Studio).

✓ That creates users, credits, payments, referrals, challenges, streaks, marketplace, and avatars — everything.

### 1.3 Let new users in instantly (important!)

1. Left menu → **Authentication** → **Providers** → **Email**.
2. Turn **OFF "Confirm email"** → **Save**. (This is the #1 reason logins "don't work" — with it on, people must verify their email before they can use the app. Off = instant access.)

## 1.4 Copy your 3 Supabase keys

Left menu → **Project Settings (gear)** → **API**. Copy these (you'll paste them later): - **Project URL** → `SUPABASE_URL` - **anon public key** → `SUPABASE_ANON_KEY` (safe to be public) - **service\_role key** → `SUPABASE_SERVICE_ROLE_KEY` ⚠ **secret — never share**

---

# PART 2 — 🌀 Paystack (getting paid by transfer)

---

## 2.1 Create + verify your account

1. Go to **paystack.com** → **Create account**.
2. Complete **business verification** (BVN/ID + business details). This unlocks **live** payments. While waiting, you can use **Test mode** to try everything.
3. Add your **settlement bank account** (Settings → Preferences/Settlement) — **this is the bank account your money lands in.** 🏦

## 2.2 Get your secret key

1. **Settings** → **API Keys & Webhooks**.
2. Copy the **Secret Key**: - `sk_test_...` while testing - `sk_live_...` once you go live → this becomes `PAYSTACK_SECRET_KEY`.

## 2.3 Set the webhook (so credits add automatically)

On that same page, find **Webhook URL** and paste:

```
https://YOUR-SITE.netlify.app/.netlify/functions/paystack-webhook
```

(You'll know your exact site address after Part 3 — come back and set this.) The webhook is how Paystack tells your app "payment received → add credits." Without it, people pay but don't get credits.

## 2.4 Money channels

Bank transfer is already switched on in the code. Customers will see **"Pay with Transfer"** at checkout, and it settles to your bank (usually next business day, or instant if you enable instant settlement in Paystack).

---

# PART 3 — 🌀 Netlify (hosting — the part that was failing)

---

**⚠️ MOST important fix:** your studio needs **Git deploy**, not drag-and-drop. Drag-and-drop can't run the secure backend. Connect the repo once and everything (landing, studio, backend) deploys together — and re-deploys automatically forever.

### 3.1 Connect your repo

1. Log into **netlify.com** → **Add new site** → **Import an existing project**.
2. Choose **GitHub** → authorise → pick your repo `jejeola11/jejeola11`.
3. **Branch to deploy:** select `claude/product-scaling-landing-page-24lhei` (or merge it into `main` first and pick `main`).

### 3.2 Build settings

- **Build command:** leave empty.
- **Publish directory:** `.` (just a dot).
- Click **Deploy**. The `netlify.toml` in your repo handles the rest (routing + functions).

### 3.3 Add your secret keys (environment variables)

Go to **Site configuration** → **Environment variables** → **Add a variable**, and add each of these (values from Parts 1 & 2):

| Key                                    | Where it came from                                                   |
|----------------------------------------|----------------------------------------------------------------------|
| <code>SUPABASE_URL</code>              | Part 1.4                                                             |
| <code>SUPABASE_ANON_KEY</code>         | Part 1.4                                                             |
| <code>SUPABASE_SERVICE_ROLE_KEY</code> | Part 1.4 (secret)                                                    |
| <code>MUAPI_KEY</code>                 | your MuAPI key                                                       |
| <code>PAYSTACK_SECRET_KEY</code>       | Part 2.2 (secret)                                                    |
| <code>APP_URL</code>                   | your site address, e.g. <code>https://fuse-studio.netlify.app</code> |

After adding them, go to **Deploys** → **Trigger deploy** → **Deploy site** so they take effect.

### 3.4 Find your site address & finish Paystack

Your site is at something like `https://fuse-studio.netlify.app` (rename it under **Site configuration** → **Change site name** if you like). Now go back to **Part 2.3** and set the Paystack webhook to that address.

---

## PART 4 — Put the 2 public keys in the app

---

The app needs your Supabase **URL** and **anon key** in one file: 1. In your repo, open `app/config.js`. 2. Replace: `js SUPABASE_URL: 'https://YOUR-PROJECT.supabase.co', SUPABASE_ANON_KEY: 'YOUR-ANON-PUBLIC-KEY'`, with your real values from Part 1.4. 3. Save/commit — Netlify auto-

redeploys.

(These two are safe to be public. Nothing secret goes in this file.)

---

## PART 5 — ⚙️ Optional features (turn on when ready)

---

- **Fuse Reactor (Claude/Gemini/ChatGPT):** make an account at [openrouter.ai](https://openrouter.ai), add credit, copy the key, and add a Netlify env var `OPENROUTER_API_KEY`. The text AIs go live instantly. (Video AIs stay "coming soon" until separately wired.)

**Meta AI Studio** (for [www.meta.com/ai](https://www.meta.com/ai)) make an account at [www.meta.com/ai](https://www.meta.com/ai), add credit, copy your key, and add a Netlify env var `FAL_KEY`. Users then upload a selfie to create an avatar and generate themselves in any scene with the same face. (Make sure you ran `schema-phase4.sql` so the `avatars` bucket exists.)

- **WhatsApp bot:** needs a **Meta WhatsApp Business** number. Add env vars `WHATSAPP_VERIFY_TOKEN` (any phrase you pick), `WHATSAPP_TOKEN`, `WHATSAPP_PHONE_ID`, then set the webhook in Meta to `.../.netlify/functions/whatsapp`. This one is advanced — ping me and I'll walk you through it when you're ready.

---

## PART 6 — ✓ Test it end-to-end

---

1. Open your site → **Start free** → sign up → you should see **12 credits**.
2. Go to **Create** → type a prompt → **Generate** → image appears, credits drop. 🤖
3. **Top up** → pick a pack → on Paystack choose **Pay with Transfer** → pay → within a few seconds your credits go up (that's the webhook working). 📬
4. On your phone: browser menu → **Add to Home Screen** → it installs like an app. ➡️
5. Try 🔥 **Daily reward**, 📬 **Academy bonus**, **Marketplace**, and your **referral link** in Profile.

---

## 🆘 Troubleshooting

---

- **"I can't sign up / log in"** → Supabase **Confirm email** is still ON (Part 1.3), or `config.js` keys are wrong/missing (Part 4).
- **"Generate says error / nothing happens"** → `MUAPI_KEY` not set in Netlify, or you deployed by drag-and-drop instead of Git (Part 3).
- **"I paid but got no credits"** → Paystack **webhook URL** not set, or it points to the wrong site address (Part 2.3). Check Paystack → Webhooks for failed deliveries.
- **"Page looks unstyled / blank"** → make sure you deployed via **Git** so the whole `app/` folder and `netlify.toml` are included.
- **Preview without any setup:** open the studio, tap "🔮 Just looking?", password **FUSE-VIP** —

tours the UI without Supabase.

## Mini-glossary

---

- **Environment variable** = a secret setting stored safely on the server (Netlify), not in the public code.
  - **Webhook** = one app automatically notifying another ("payment received!").
  - **Anon vs service key** = anon is the public "front-desk" key; service is the private "master" key (server only).
  - **Deploy** = publishing your latest code to the live site.
